MVP Microsoft® Most Valuable Professional

In this session

- Why is the official guidance so hard to implement?
- Why do we think we need to get rid of NTLM in the first place?
- How do we get there without causing disruption?

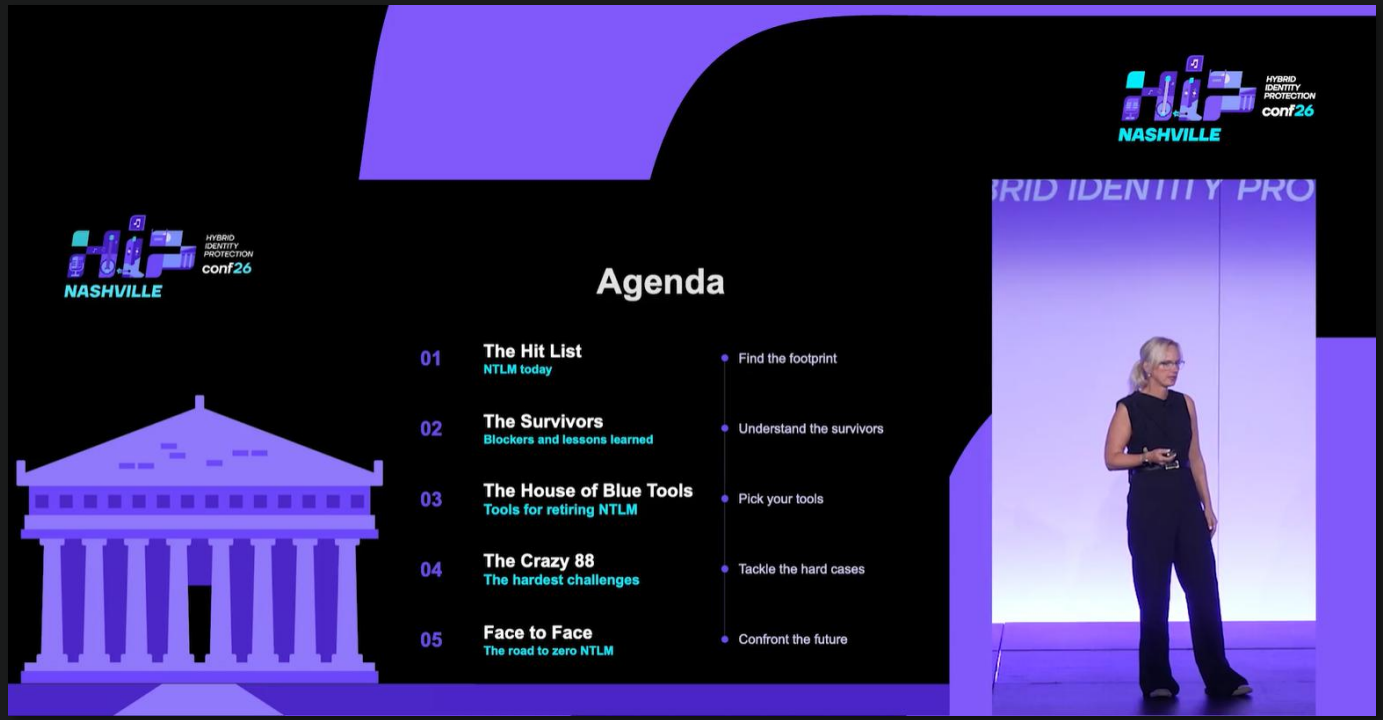

Not in this session

NIC26

Why is first-party guidance so difficult?

https://www.hipconf.com/resources/lets-retire-ntlm/

NIC26

Microsoft *vs.* <your org>

long-term goal	Create a Windows version that is free of NTLM	Protect environment from NTLM-based threat vectors
way towards goal	Disable NTLM on every computer, then on DCs	Ensure that privileged™ principals are excluded from NTLM AuthN
tools to achieve goal	Group policy → registry LocalKDC (soon™)	AuthN Policies | Tiering Protected Users Firewall, DNS

So why couldn‘t they just speak Kerberos?

NIC26

Mission Statement

- Take care of „known knowns“ (DFS-N, ADCS, …)
- Determine root causes from investigation, not from symptoms
  - …because we‘re engineers, not charlatans
- Ignore local AuthN for now
  - LocalKDC will take care of that, eventually. Until then, I could care less.
- Use the minimum data necessary to gauge progress
  - #DCs < #Servers < #Clients < #Users

THANK YOU FOR STICKING WITH ME!
